

# Interface Overview

1. **Listening Port** - Specify the port for Ayva WebSocket Hub to monitor incoming connections. Any [TCode](#) received on this port will be routed to the connected outputs. Click the *Start* button to begin monitoring for incoming connections. Data forwarding will commence immediately upon establishing a connection.
2. **Add Output** - Use this dropdown menu to select and add output streams.
3. **Outputs** - This table lists all configured outputs—which are saved across sessions—along with their connection status. You can enable or disable streaming to any listed output by using the checkbox in the *Enabled* column.
4. **Incoming Connection State** - This indicates the status of the incoming connection, which can be *Disconnected*, *Listening* or *Connected*.
5. **Patreon Link** - Ayva Software is supported by the community. This is a link to the [Patreon](#).
